Strain Worksheet

In your jotter, copy the follow questions and answer.

1. A steel wire 4.0m long is used to support a load. When the load is applied the wire stretches by 2.5mm. Calculate the strain of the wire.

   Remember to have the original length and change in length in the same units

2. A wire 10m long stretches 5.0mm when a force is applied at one end. Calculate the strain.

3. The allowable strain on a bar is 0.0075 and its length is 2.5m. Calculate the change in length.

4. During testing, a steel rod stretches 0.6mm. If the resulting strain was 0.0012, what is the original length of the rod?
