Heat energy

National 5 · Engineering contexts & challenges · Class worksheet

ENGINEERING WITH MR KELLY

Name _____ Class _____ Date _____

By the end of this worksheet I can…

- ☐ calculate heat energy using $E_h = cm\Delta T$
- ☐ find the change in temperature ΔT
- ☐ rearrange the formula to find a final temperature
- ☐ use the specific heat capacity from the data booklet

I DO — Key ideas and worked example

Read this first

$E_h = cm\Delta T$

Heat energy = specific heat capacity × mass × change in temperature

- Specific heat capacity c in J/kg K (water = 4180 J/kg K)
- Mass m in kilograms (kg); 1 litre of water = 1 kg
- Change in temperature ΔT in °C (or K)
- Energy E_h in joules (J)

Remember

ΔT is the change: final temperature − starting temperature. Water boils at 100 °C. If c is given in kJ/kg K, multiply by 1000 to get J/kg K.

A hot water tank holds 200 litres of water at 18 °C.

Example Calculate the energy needed to heat the water to 50 °C.

Worked answer set out every step like this

m = 200 kg, $\Delta T = 50 - 18 = 32$ °C

$E_h = cm\Delta T = 4180 \times 200 \times 32$

E_h = 26 752 000 J = 27 MJ

Why marks are not awarded

✗ Using the final temperature instead of the change in temperature

WE DO — Guided practice

Follow the steps to help you

1.75 kg of water at 18 °C is heated until it begins to boil.

1 Calculate the heat energy needed. (3 marks)

Steps

1. Boiling point is 100 °C, so $\Delta T = 100 - 18 = \ldots$
2. Substitute into $E_h = 4180 \times 1.75 \times \ldots$
3. Round to two significant figures and give the unit

YOU DO **On your own** Give answers to two significant figures. Show your working.

2 A kettle holds 1.5 litres of water at 5 °C. Calculate the heat energy needed to raise its temperature to each value.

Final temperature	ΔT (°C)	Working	E_h
50 °C			
40 °C			
80 °C			
100 °C			

3 57 kJ of heat energy is supplied to 1.7 kg of oil with a specific heat capacity of 2.7 kJ/kg K. The oil starts at 3 °C. Calculate its final temperature. (4 marks)

4 Calculate the energy needed to raise the temperature of 750 g of water from 34 °C to 91 °C.

5 An electric heater supplies 13 500 J to a 0.5 kg metal block, raising its temperature from 20 °C to 80 °C. Calculate the specific heat capacity of the metal.
